Assistant Commissioner for Patents
Washington, D.C. 20231

Sir:

Transmitted herewith for filing is the patent application, including 7 sheet(s) of formal drawings, of inventor(s):
DONALD C. D. CHANG, ALAN CHA

**CONCURRENT COMMUNICATIONS BETWEEN A USER TERMINAL AND MULTIPLE STRATOSPHERIC
TRANSPONDER PLATFORMS**

The filing fee for this application is calculated below:

	CLAIMS AS FILED				
	NUMBER FILED	NUMBER EXTRA	RATE		
Basic Fee					\$ 690.00
Total Claims	24	-20 =	4	x \$ 18.00	\$ 72.00
Independent Claims	3	- 3 =	0	x \$ 78.00	\$
Multiple Dependent Claims				+ \$260.00	\$
TOTAL FILING FEE :					\$ 762.00

Please charge Deposit Account No. 50-0383 of Hughes Electronics Corporation, El Segundo, California, in the amount of **\$762.00**. The Commissioner is hereby authorized to charge any additional fees which may be required, or credit any overpayment, to that account.

The Commissioner is further hereby authorized to charge to said above Deposit Account No. 50-0383, pursuant to 37 CFR 1.25(b), any fees whatsoever which may properly become due or payable, as set forth in 37 CFR 1.16 to 1.17 inclusive, for the entire pendency of this application without specific additional authorization.

**Please associate this application with the Hughes Electronics Corporation Customer Number 020991.
This form is submitted in triplicate.**

**CONCURRENT COMMUNICATIONS BETWEEN A USER TERMINAL AND
MULTIPLE STRATOSPHERIC TRANSPONDER PLATFORMS**

5

BACKGROUND OF THE INVENTION

The present invention relates generally to stratospheric transponder platform communications systems. More specifically, but without limitation thereto, the present invention relates to an architecture for communicating between a user terminal and multiple stratospheric transponder platforms.

In future stratospheric communications systems, it is expected that multiple stratospheric transponder platforms will be employed by several service providers to transmit communications signals using the same frequency band. The capability of a user terminal receiver on the ground to access different services from multiple stratospheric transponder platforms is important to the viability of the transponder platform system. Although a phased array antenna at the user terminal may be used to steer the beam from one stratospheric platform to another to avoid signal interference, such antennas are too expensive for the mass consumer market. Similarly, using separate antennas to track each stratospheric transponder platform is not practical for low cost terminals. A method is therefore needed for communicating between a user terminal and multiple stratospheric platforms using low cost antennas that do not require either a tracking mechanism or beam forming circuitry.

SUMMARY OF THE INVENTION

The present invention advantageously addresses the needs above as well as other needs by providing a method and apparatus for concurrent communications between a user terminal and multiple stratospheric transponder platforms using inexpensive antennas.

In one embodiment, the invention may be characterized as a method for communicating between a user terminal and multiple stratospheric transponder platforms that includes the steps of maintaining a plurality of stratospheric transponder platforms in a substantially fixed position with respect to a user terminal antenna coupled to a user terminal and communicating between the user terminal and at least two of the plurality of stratospheric transponder platforms concurrently.

In another embodiment, the invention may be characterized as a communications system for communicating between a user terminal and multiple stratospheric transponder platforms that includes a user terminal antenna coupled to a user terminal, a gateway hub for interfacing with a plurality of stratospheric transponder platforms having a substantially fixed position with respect to the user terminal antenna for communicating between the user terminal and each of the plurality of stratospheric transponder platforms concurrently.

The features and advantages summarized above in addition to other aspects of the present invention will become more apparent from the description, presented in conjunction with the following drawings.

BRIEF DESCRIPTION OF THE DRAWINGS

The above and other aspects, features and advantages of the present invention will be more apparent from the following more specific description thereof, 5 presented in conjunction with the following drawings wherein:

FIG. 1 is a block diagram of a stratospheric transponder platform communications system for communicating between a user terminal and multiple 10 stratospheric transponder platforms concurrently according to an embodiment of the present invention;

FIG. 2 is a detailed diagram of one of the multiple beams in FIG. 1;

FIG. 3 is a detailed diagram of a single 15 reflector multiple beam antenna according to an embodiment of the present invention for forming two of the beams shown in FIG. 1;

FIGS. 4A and 4B are side views of exemplary feedhorn shapes for the single reflector multiple beam 20 antenna of FIG. 3;

FIG. 5 is a beam plot of the beams formed by the single reflector multiple beam antenna of FIG. 3;

FIG. 6 is a diagram of a communications system according to another embodiment of the present invention 25 for providing multiple data rates;

FIG. 7 is a diagram of a communications system according to a further embodiment of the present invention for accessing multiple Internet routers; and

FIG. 8 is a detailed block diagram of the 30 communications system of FIG. 1.

Corresponding reference characters indicate corresponding components throughout the several views of the drawings.

5

DETAILED DESCRIPTION OF THE DRAWINGS

The following description is presented to disclose the currently known best mode for making and using the present invention. The scope of the invention is defined by the claims.

10 FIG. 1 is a diagram of a stratospheric platform communications system 100 for communicating between a user terminal and multiple stratospheric transponder platforms concurrently. Shown are a gateway hub 101, stratospheric transponder platforms 102, 104, 106, and 108, additional stratospheric transponder platforms 109, a platform orbit 110, a platform separation 112, a platform altitude 114, an antenna axis 150, a point 152 at the center of the formation of the stratospheric transponder platforms 102, 104, 106 and 108, a single reflector user terminal antenna 116, a user terminal 117, and four receiving beams 154, 156, 158 and 160.

15

20

In this example, the stratospheric transponder platforms 102, 104, 106 and 108 are communications satellites arranged in a substantially fixed, square formation relative to the user terminal antenna 116 and are separated by the platform separation 112 of about 10 km. Alternatively, unmanned aircraft, antenna towers, and other transponder platforms may be used to suit specific applications. Also, more than one gateway hub 25 101 may be used in conjunction with one or more of the stratospheric transponder platforms 102, 104, 106 and 108 30

to communicate with the user terminals 117 via the user terminal antenna 116. User terminal 116 is preferably a single reflector, multiple beam antenna, but may also be separate single reflector antennas. The platform separation 112 of 10 km is computed using a platform altitude of 20 km based on interference considerations. The platform altitude 114 of 20 km is preferable for maintaining each of the stratospheric transponder platforms 102, 104, 106 and 108 in a designated orbit because the average wind velocity is at a minimum at that altitude.

To avoid the requirement of a tracking system to track each of the stratospheric transponder platforms 102, 104, 106 and 108, the platform orbit 110 of each of the stratospheric transponder platforms 102, 104, 106, 108 is maintained in a small circle about 2 km in diameter.

In this arrangement, the stratospheric transponder platforms 102, 104, 106 and 108 relay four separate communications signals concurrently between a user terminal via the user terminal antenna 116 and the gateway hub 101. The spatial diversity of the stratospheric transponder platforms 102, 104, 106 and 108 allows the same frequency band to be shared by the four separate communications signals. Thus, the user terminal 117 is capable of receiving communications signals from the stratospheric transponder platforms 102, 104, 106, 108 using the same frequency band and at the same time. Additional stratospheric transponder platforms 109 may be used to communicate between the gateway hub 101 and the

user terminal 117 as well as with other user terminals in various combinations to suit a variety of applications.

One method by which separate service providers may use the same frequency band without interfering with 5 one another is to provide the user terminal 117 with a separate single beam reflector antenna 118 for each of the stratospheric transponder platforms 102, 104, 106 and 108. Disadvantages of this method include high cost and the labor time involved in setting up each of the four 10 reflectors.

A preferred method is to implement the user terminal antenna 116 with a single reflector multiple beam antenna. The single reflector multiple beam antenna is aimed along an antenna axis 150 to a point 152 at the 15 center of the formation of the stratospheric transponder platforms 102, 104, 106 and 108. In this example, the user terminal antenna 116 forms four beams 154, 156, 158 and 160 that are offset from the antenna axis 150 and aimed at each of the stratospheric transponder platforms 20 102, 104, 106 and 108 respectively. For example, the beam 154 is aimed at the stratospheric transponder platform 108, the beam 156 is aimed at the stratospheric transponder platform 102, the beam 158 is aimed at the stratospheric transponder platform 106, and the beam 160 25 is aimed at the stratospheric transponder platform 104.

In this example the beams 154, 156, 158 and 160 are used for receiving, however, in other contemplated arrangements, the beams 154, 156, 158 and 160 may also be used for transmitting communications signals to the 30 stratospheric transponder platforms 102, 104, 106 and 108.

FIG. 2 is a detailed diagram of one of the beams shown in FIG. 1. The description below for the beam 160 is also applicable to the beams 154, 156, and 158. The diameter of the platform orbit 110 and the 5 platform altitude 114 of the stratospheric transponder platform 102 determines a half-power beam width (HPBW) 206 and a reflector diameter 208 of the single reflector multiple beam antenna. Because the diameter of the platform orbit 110 is small compared to the platform 10 altitude 114, the location of the single reflector multiple beam antenna within the service area of the stratospheric transponder platforms 102, 104, 106 and 108 is not critical, as long as the antenna axis 150 points in the direction of the point 152 at the center of the 15 formation of the stratospheric transponder platforms 102, 104, 106 and 108.

An orbit angle 204 subtended by the platform orbit 110 at the platform altitude 114 in this example is approximately 5.5° . To ensure that the stratospheric 20 transponder platform 106 will always be near the peak of the single beam 160, the half-power beam width 206 is preferably twice the platform orbit angle 204 as viewed from the single reflector multiple beam antenna, i.e.,

$$\text{HPBW} \approx 2 \times 5.5^\circ = 11^\circ \quad (1)$$

25 This beam width allows the single beam 160 to track the stratospheric transponder platform 106 without a tracking mechanism. The diameter D of the reflector for the single reflector multiple beam antenna may be found by

$$D = 65 \lambda / \text{HPBW} \approx 90 \text{ cm} \quad (2)$$

30 where λ is the wavelength, which is about 15 cm at 2 GHz.

Once the reflector diameter 208 of the single reflector multiple beam antenna is determined, the platform separation 112 between the stratospheric transponder platforms 102, 104, 106 and 108 for forming 5 multiple beams may be determined from interference considerations. For example, a convenient design criterion is that the stratospheric transponder platforms 102, 104, 106 and 108 be at least $2 \times \text{HPBW}$ apart to ensure that the signal to interference ratio is at least 10 20 dB between any two of the beams 154, 156, 158 and 160.

Table 1 below illustrates a typical platform separation vs. beam spacing for the single reflector multiple beam antenna 116 in FIG. 1. As shown in Table 1, increasing the separation between stratospheric 15 transponder platforms 102, 104, 106 and 108 over the range from 8 km to 12 km increases the angle between adjacent beams, or beam spacing, from 22° to 33° .

TABLE 1

BEAM SPACING	PLATFORM SEPARATION
$22^\circ/2 \text{ HPBW}$	8 Km
$28^\circ/2.6 \text{ HPBW}$	10 Km
$33^\circ/3.0 \text{ HPBW}$	12 Km

Table 2 below illustrates a typical platform separation vs. signal-to-interference ratio for the single reflector multiple beam antenna 116 in the system of FIG. 1. As shown in Table 2, increasing the platform 30 separation over the range from 8 km to 12 km increases the signal-to-interference ratio from 20 dB to 29 dB.

TABLE 2

SIGNAL-TO-INTERFERENCE POWER RATIO	PLATFORM SPACING
20 dB	8 Km
23 dB	10 Km
29 dB	12 Km

FIG. 3 is a diagram of a single reflector
 10 multiple beam antenna 300 for forming two of the beams
 shown in FIG. 1. The other two beams are omitted for
 clarity, however, the same description applies for adding
 additional beams. Shown are an antenna mast 302, an
 antenna mount 304, a tilt angle 306, a tilt arm 308, an
 15 antenna axis 310, an antenna reflector 312, an antenna
 diameter 314, a focal point 316, a focal length 315, two
 feedhorns 318 and 320, a beam spacing mount 322, and an
 offset 324.

The antenna mast 302 supports the antenna mount
 20 304. The antenna mount 304 has a tilt angle 306 that may
 be adjusted by the tilt arm 308 to aim the single
 reflector multiple beam antenna 300 at the point 152 at
 the center of the formation of the stratospheric
 transponder platforms 102, 104, 106 and 108 along the
 25 antenna axis 150. The antenna reflector 312 is mounted
 at one end of the antenna mount 304. The antenna
 diameter 314 is determined as explained above. The focal
 point 316 of the antenna reflector 312 is located at a
 distance equal to the focal length 315 from the antenna
 reflector 312. The beam spacing mount 322 is mounted at
 30 the end of the antenna mount 304 opposite to the antenna
 reflector 312. The two feedhorns 318 and 320 are
 positioned on the beam spacing mount 322 so that they are

each displaced from the focal point 316 by the offset 324 to form two separate beams pointed respectively at two of the stratospheric transponder platforms 102, 104, 106 and 108. Additional beams may be formed by adding feedhorns 5 on the beam spacing mount 322 at positions offset from the focal point 316 as described above for the feedhorns 318 and 320.

Locating the feedhorns 318 and 320 offset from focal point 316 to form multiple beams provides a low cost

10 alternative to reflector antennas that locate a single feedhorn at the focal point to form a single beam. Exemplary design values for the single reflector multiple beam antenna 116 are 90 cm for the diameter D , 102 cm for the focal length 315, and 22 cm for the offset 324.

15 FIGS. 4A and 4B are side views of exemplary feedhorn designs for the reflector antenna of FIG. 3. FIG. 4A illustrates a stepped feedhorn 402 having a length 404 and an aperture 406. An exemplary value for both the length 404 and the aperture 406 is 22 cm. FIG. 20 4B illustrates a stepped and tapered feedhorn 450 having a length 452 and an aperture 454. Exemplary values for the length 452 and the aperture 454 are 27 cm and 22 cm, respectively.

FIG. 5 is a beam plot 500 of multiple beams 502 25 and 504 formed by the reflector antenna 116 of FIG. 3. The two peak responses 502 and 504 are spaced 22° apart and are representative of any two of the multiple beams 154, 156, 158 and 160. The signal-to-interference noise ratio is 20 dB for a beam spacing of 22° corresponding to 30 a platform orbit diameter of 2 km and a platform separation of 8 km as shown in table 1.

FIG. 6 is a diagram of a communications system 600 for providing multiple data rates. Shown are the gateway hub 101, the stratospheric transponder platforms 102, 104, 106, and 108, the user terminal antenna 116, 5 and the user terminal 117. In this example, the gateway hub interfaces to communications signal sources having separate data rates.

The single reflector multiple beam antenna described above may be used in this example as the user 10 terminal antenna 116. The user terminal antenna 116 is coupled to the user terminal 117 for communicating with the gateway hub 101 using a separate data rate via each of the stratospheric transponder platforms 102, 104, 106, and 108. The user terminal 117 may include signal 15 amplifier / pre-amplifiers (not shown) for pre-amplifying received signals and amplifying transmitted signals from the user terminal 117 according to standard techniques well known in the art. Alternatively, the signal amplifier / pre-amplifiers may be included with the user 20 terminal antenna 116. The user terminal 117 may also include a multiplexer / demultiplexer (not shown) for separating and mixing the communications signals to and from the stratospheric transponder platforms 102, 104, 106, and 108 according to well known techniques. Each of 25 the communications signals may have a separate data rate, and the communications signals may also share the same frequency band concurrently.

FIG. 7 is a diagram of a communications system 700 according to a further embodiment of the present 30 invention for accessing multiple Internet routers concurrently.

The communications system 700 is similar in structure to the communications system 600 in FIG. 6, except that the gateway hub 101 interfaces to the Internet via separate Internet routers. By accessing the

5 Internet through multiple routers, the user terminal 117 can increase data throughput and accommodate individual router and transponder platform failures without interruption of service. If any of the routers or stratospheric transponder platforms should fail, Internet

10 traffic would continue through the operational routers and stratospheric transponder platforms according to standard network management techniques for Internet traffic such as packet assemblers and sequencers.

FIG. 8 is a diagram of a communications system
15 800 for receiving multiple channels from separate communications service providers concurrently.

The communications system 800 is similar in structure to the communications system 600 in FIG. 6, except that the gateway hub 101 interfaces to separate
20 communications service providers for communicating on multiple channels concurrently using the same frequency band.

Other modifications, variations, and arrangements of the present invention may be made in
25 accordance with the above teachings other than as specifically described to practice the invention within the spirit and scope defined by the following claims.

CLAIMS

What is claimed is:

- 5 1. A method for communicating between a user terminal and multiple stratospheric transponder platforms comprising the following steps:
 maintaining stratospheric transponder platforms in a substantially fixed position with respect to a user
10 terminal antenna coupled to a user terminal; and
 communicating between the user terminal and at least two of the stratospheric transponder platforms concurrently.
- 15 2. The method of Claim 1 wherein the user terminal communicates with the at least two of the stratospheric transponder platforms using the same frequency band.
- 20 3. The method of Claim 1 wherein the user terminal communicates with one of the at least two of the stratospheric transponder platforms at a first data rate and with another of the at least two of the stratospheric transponder platforms at a second data rate.
- 25 4. The method of Claim 1 wherein the user terminal communicates with a first Internet router via one of the at least two of the stratospheric transponder platforms and with a second Internet router via another
30 of the at least two of the stratospheric transponder platforms.

5. The method of Claim 1 wherein the user terminal communicates with a first media service provider via one of the at least two of the stratospheric transponder platforms and with a second media service provider via another of the at least two of the stratospheric transponder platforms.

6. A communications system for communicating between a user terminal and multiple stratospheric transponder platforms comprising:

a user terminal antenna coupled to a user terminal; and

a plurality of stratospheric transponder platforms having a substantially fixed position with respect to the user terminal antenna for communicating between the user terminal and each of the plurality of stratospheric transponder platforms concurrently.

7. The communications system of Claim 6 wherein the user terminal antenna communicates with at least two of the plurality of stratospheric transponder platforms using the same frequency band.

8. The communications system of Claim 6 wherein the user terminal antenna communicates with one of the plurality of stratospheric transponder platforms at a first data rate and with another of the plurality of stratospheric transponder platforms at a second data rate.

9. The communications system of Claim 6
wherein the user terminal antenna communicates with one
of a plurality of Internet routers via one of the
plurality of stratospheric transponder platforms and with
5 another of the plurality of Internet routers via another
of the plurality of stratospheric transponder platforms.

10. The communications system of Claim 6
wherein the user terminal antenna communicates with one
10 of a plurality of communications service providers via
one of the plurality of stratospheric transponder
platforms and with another of the plurality of
communications service providers via another of the
plurality of stratospheric transponder platforms.
15

11. The communications system of Claim 6
wherein the user terminal antenna comprises:
a single antenna reflector having a focal
length and a focal point;
20 and at least two feedhorns coupled to the
single antenna reflector for forming multiple beams.

12. The communications system of Claim 11
wherein the at least two feedhorns are coupled to the
25 single antenna reflector at a distance substantially
equal to the focal length and are offset from the focal
point by a distance selected to form the multiple beams.

13. The communications system of Claim 11
30 wherein the multiple beams are equally spaced.

14. The communications system of Claim 11 wherein one of the at least two feedhorns is a stepped feedhorn.

5 15. The communications system of Claim 11 wherein one of the at least two feedhorns is a stepped and tapered feedhorn.

10 16. The communications system of Claim 11 wherein at least one of the multiple beams has a half-power beam width substantially equal to twice an orbit angle subtended by a stratospheric platform.

15 17. The communications system of Claim 11 wherein the stratospheric transponder platforms have a platform spacing selected to maintain a signal-to-interference ratio of at least 20 dB.

20 18. The communications system of Claim 11 wherein the stratospheric transponder platforms have an orbit diameter selected to maintain the stratospheric transponder platforms respectively near a peak of each of the multiple beams.

25 19. The communications system of Claim 11 wherein the multiple beams have a spacing such that the signal-to-interference ratio between beams is at least 20 dB.

20. A method for communicating between a user terminal and multiple stratospheric transponder platforms comprising the following steps:

5 maintaining a plurality of stratospheric transponder platforms at a substantially constant platform altitude, platform spacing, and platform orbit diameter; and
communicating between each of the plurality of stratospheric transponder platforms and a user terminal on multiple beams concurrently via a user terminal
10 antenna coupled to the user terminal.

21. The method of Claim 20 wherein the step of communicating comprises communicating between the user terminal and each of the plurality of stratospheric transponder platforms using the same frequency band.
15

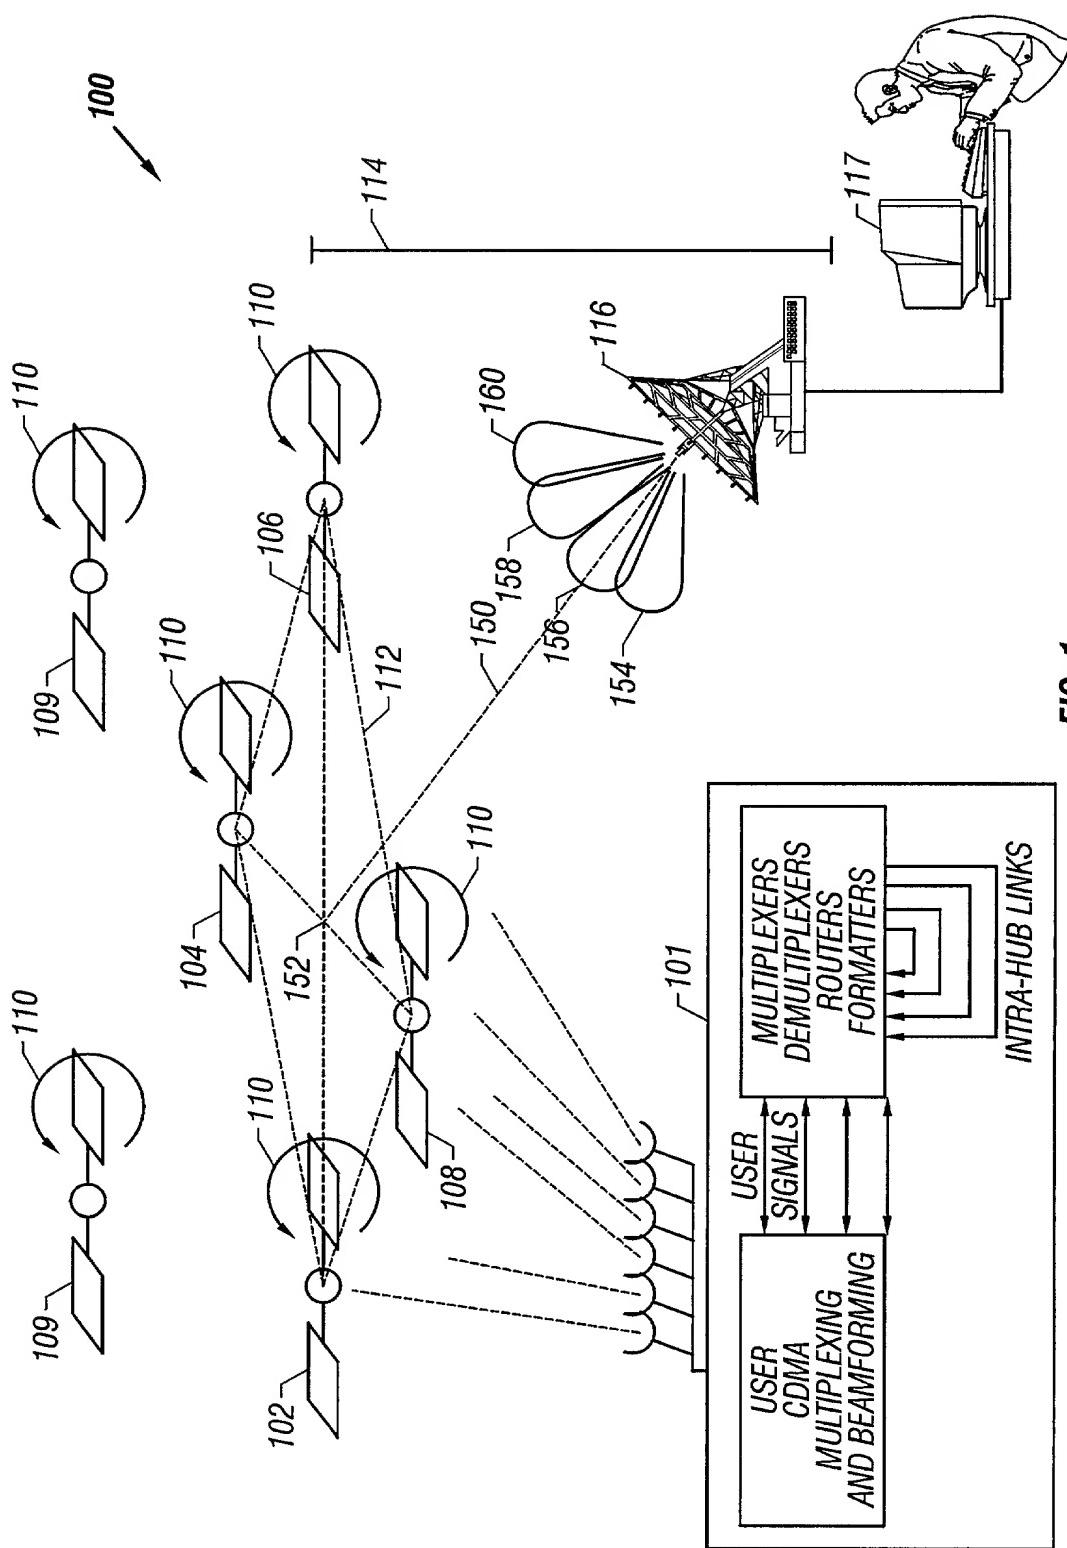

22. The method of Claim 20 further comprising the step of separating the multiple beams such that the signal-to-interference ratio between any two of the
20 multiple beams is at least 20 dB.

25
23. The method of Claim 20 wherein the platform separation is at least two half-power beam widths.

24. The method of Claim 21 wherein the platform orbit diameter is selected to maintain each of the stratospheric transponder platforms near a peak of the multiple beams respectively.
30

ABSTRACT

A method for communicating between a user terminal and multiple stratospheric transponder platforms includes the steps of positioning a plurality of 5 stratospheric transponder platforms (102, 104, 106, 108) in a substantially fixed position (152) with respect to a user terminal antenna (116) coupled to a user terminal (117) and communicating between the user terminal (117) and at least two of the plurality of stratospheric 10 transponder platforms (102, 104, 106, 108) concurrently.
